

T-31-25

# ULTRA LOW NOISE K-BAND HETRO JUNCTION FET

**NE32100**  
**NE32183A**  
**NE32184A**

## FEATURES

- **SUPER LOW NOISE FIGURE:**  
NF = 1.0 dB TYP at f = 12 GHz
- **HIGH ASSOCIATED GAIN:**  
GA = 10.5 dB TYP at f = 12 GHz
- **GATE LENGTH:**  $L_g = 0.3 \mu\text{m}$
- **GATE WIDTH:**  $W_g = 200 \mu\text{m}$

## DESCRIPTION

The NE321 is a Hetero-Junction FET that utilizes the junction between Si-doped AlGaAs and undoped GaAs to create a two-dimensional electron gas layer which has higher electron mobility than conventional GaAs MESFETs. The device features mushroom shaped TlAl gates for decreased gate resistance and improved power handling capabilities. The mushroom gate results in lower noise figure and high associated gain for satellite communications, narrow and broadband amplifiers (for military and commercial uses) as well as high volume consumer applications.

The surface of the device, except for the bonding pads, is passivated with layers of SiO<sub>2</sub> and SiN<sub>4</sub> for scratch protection as well as surface stability.

The NE321 device is available in chip form (00), a solder sealed hermetic, metal/ceramic package (83A) and an epoxy sealed metal/ceramic package (84A).

NEC's stringent quality assurance and test procedures assure the highest reliability and performance.

## OUTLINE DIMENSIONS

**TYPICAL PERFORMANCE CURVES** (TA = 25°C)

**Notes:**

1. R<sub>TH</sub> is (channel to case) for chips mounted on an infinite heat sink.
2. Typical values of noise figures are those obtained when 50% of the devices from a large number of lots were individually measured in a circuit with the input individually tuned to obtain the minimum value. Maximum values are criteria established on the production line as a "go-no-go" screening tuned for the "generic" type but not for each specimen.
3. RF performance is determined by packaging and testing 10 samples per wafer; wafer rejection criteria for standard devices is 2 rejects for 10 samples.
4. Gain Calculations:  $MAG = \frac{|S_{21}|}{|S_{12}|} (K \pm \sqrt{K^2 - 1})$ . When  $K \leq 1$ ,  $MAG = MSG$ .

$$MSG = \frac{|S_{21}|}{|S_{12}|}, K = \frac{1 + |\Delta|^2 - |S_{11}|^2 - |S_{22}|^2}{2|S_{12}||S_{21}|}, \Delta = S_{11}S_{22} - S_{21}S_{12}$$

MAG = Maximum Available Gain  
MSG = Maximum Stable Gain
